

MOVE SOLUTIONS

DATASHEET OF DECK DISPLACEMENT SENSOR

SYSTEM FOR MONITORING

Move Solutions for monitoring the stability of a structure recommends **DECK** sensors, devices capable of capturing the amplitude of dynamic oscillation. Thanks to the use of this sensor it is possible to continuously monitor the modal parameters of the structure and verify its stability over time. It is also possible to understand the amplitude of the dynamic deformation, or even any seismic vibrations and monitor the risk.

The Move monitoring system also includes **Accelerometers** for modal study, **Tiltmeters** for static monitoring and **Strain gauges** for monitoring cracks and openings. Using the **Communication Node** with multiple inputs (analog or digital) it is possible to monitor the water pressure and many other parameters of the surrounding areas.

FEATURES

- High precision
- Data analysis with advanced algorithms
- No wiring
- Long-range communication
- Modular system
- High autonomy
- Complete management and customization
- Minimum maintenance required
- Strong design

MEASUREMENTS

- Dynamic displacement amplitude monitoring
- Modal analysis of the structure
- Vibrational study of the structure
- Static monitoring of the inclination of the structure
- Analysis of the amplitude of the dynamic deformation
- Monitoring of cracks and openings
- Real-time water pressure monitoring
- Highlighting of seismic vibrations

HOW IT WORKS

Move Solutions includes a complete package of wireless devices and a **Web Platform** for data visualization and sensor management. Once the sensors and system gateways are properly installed on site, they are ready to receive, store and send data.

You can view all this data in real time through a Web interface that allows users to remotely monitor the site or infrastructure. The user can set different parameters for each individual sensor, including sampling rates, resolution, alarm thresholds, activation and much more. The Move Solutions monitoring system guarantees accuracy, safety and reliability and a significant reduction in overall monitoring costs.

LOGISTICAL-ECONOMIC ADVANTAGES

- Remote monitoring of difficult to access structures
- Ease of installation and use of the system
- Data processing to optimize operations
- Easy addition of sensors to extend the monitored area
- Cost reduction through easy maintenance
- No wiring, saving on installation materials
- Consequent labor savings
- Risk reduction and high reliability

DECK DEVICE

The DECK device is the only patented wireless sensor on the market capable of measuring the uniaxial oscillations of the structure providing displacement values with an accuracy equal to that of the interferometric radar (0.01 mm). The DECK device samples at 100 Hz, constantly and remotely. It is also capable of detecting temperature and vibration frequency. DECK is battery powered and uses the LoRaWAN wireless communication protocol.

OUTPUT DECK

DECK acquires data from 10 seconds before to 20 seconds after (tot. 30 seconds) each stress of the structure when the activation threshold previously set on the Web Platform is exceeded. The displacement values measured are expressed in mm. It also acquires temperature data.

DOWNLOAD DOCUMENTATION

Visit the website at www.movesolutions.it to download further documentation relating to technical specifications and/or information on the Move Solutions™ structural monitoring system.

QUICK GUIDE TO USE

The DECK sensor is “plug and play”; by screwing the special antenna on its cover, the device will immediately start trying to communicate with the Gateway. To ensure that the device is working properly the DECK device must be oriented and installed correctly, following these specific steps:

1. ORIENTATION:

- The symbol shown in the center of the label indicates which is the axis of the structure (X; Y; Z) with respect to which the DECK device collects measurements. This symbol also shows the orientation and direction of that axis. Therefore:
 - The axis of the structure of interest to the measurement must be aligned and oriented according to the representation of the symbol.
 - The letter identifies DECK’s specific measurement axis.
Z axis = Gravitational axis.
X - Y axes = Longitudinal or transverse axis of the structure.

2. INSTALLATION ON THE STRUCTURE:

- The installation location may vary depending on the orientation label on the device. Agree with the supplier company on the correct place of installation of the DECK device on the structure.
- Securely install the DECK device on the wall, ceiling or floor using the special plate and screws/wall plugs supplied.
- Install all sensors on the structure before powering and turning on the Gateway device.

3. SCREWING THE ANTENNA:

- Before activating the Gateway, screw the LoRaWAN 868 Mhz antenna onto the DECK device cover.

After meeting these orientation and installation requirements, the DECK device will be able to detect and forward data to the Gateway without interference or data alteration. Verify, via the Web Platform, if the sensor just installed is working properly. From the moment the Gateway is powered up, and therefore from the actual start-up and activation moment, a maximum waiting of about an hour is required before it is possible to correctly view all the sensors online.

DECK DEVICE

Deck is the only sensor on the market for measuring the dynamic oscillation amplitude with an accuracy of 0.01 mm. It also detects the temperature and vibration frequency of any structure. Perfect for continuous remote monitoring of dams, bridges, viaducts and buildings and for dynamic load tests. Wireless device with battery power and LoRaWAN transmission.

TECHNICAL SPECIFICATIONS

OPERATION

Operation with programmed acquisitions

Record of an event for each oscillation that exceeds the activation threshold set by the user. For each event: acquisition of displacement for 30 seconds (10 seconds before and 20 seconds after exceeding the threshold). Acquisition of the temperature at each event.

Custom Operation Software

It is possible to request custom features that the customer deems necessary for their business.

Sampling Frequency

50 Hz

MEASUREMENT

Acquisition of

- Displacement
- Temperature

Displacement Resolution

0.012mm, 0.024mm

Shift Accuracy

±0,01 mm

Measurement of Axis

of the Parallel axis to the gravity axis (Z) or perpendicular (X or Y)

Range

± 1.5 mm, ± 3mm

Displacement Bandwidth (-3DB)

0.70 - 15 Hz

Temperature accuracy

0,5°C

Temperature Resolution

0,125°C

RADIO

Central Processing Unit	ARM Cortex M0 32 Bit
Radio channel frequency	868 MHz (EU) - 125 KHz BW (LoRaWAN)
Transmission Power	14 dBm
Link coverage	1km (line of sight with the Gateway)*

GENERAL DATA

Waterproof Rating	IP67
Reliability	Internal Watchdog (Inside the Microcontroller) External Watchdog (External to the Microcontroller)
Battery	4 lithium battery type "D" 19Ah 3.6V
Operating temperatures	-40°C/+85°C
Dimensions case	140 x 170 x 65 mm
Dimensions case+plate	200 x 200 x 80 mm
Weight	2.4 Kg

INSTALLATION

Method	Four-point mounting using screws and plugs (Ø10mm, L:30mm)
Site	<ul style="list-style-type: none"> • Fixing on wall • Fixing on ceiling • Fixing on ground

BATTERY AUTONOMY

Sample rate	Estimated autonomy
5 samplings / hour	2 years*

* Wireless coverage of the device may vary depending on the scenario

* Battery life may shorten when operating in extreme temperatures.

Note: Specifications are subject to review and change without notice.
